* [Excluding VXFC]

Applicable for high temperature

Fluid temperature
100°C

Large port size is available.

Port size
50A to 100A

Enclosure

IP65*

* Electrical entry flat terminal type terminal is IP40.

Flange type

Mounting can be changed depending on the piping conditions!

Flange body type

Orifice machining on the outlet is not necessary, so piping man hour is reduced!

Built-in full-wave rectifier type (AC specification)

- **Improved durability**
Service life is extended by the special construction.
(compared with current shading coil)
- **Reduced apparent power (for normal temperature)**
11 VA → **7 VA** (Size 21, 22, 24, 25, 26, 27, 28)
18 VA → **10 VA** (Size 23)
- **Noise reduction**
Rectified to DC by the full-wave rectifier, resulting in a
buzz noise reduction.

Solenoid Valve Type VXF2 Series

Air Operated Type VXFA2 Series

The valve controller turns ON/OFF many valves for the dust controller.

Two-time Hitting Function

A two-time hitting function is adopted to improve the bag filter dusting efficiency. Turn ON the DIP switch for two-time hitting (OFF for one-time hitting). (Effective up to the number of setting channels)

Operation sequence diagram

Interrupt Operation Function

Interrupting an operation from an external switch is possible using input signals.

Operation sequence diagram

Cascade Connection (Multiple-board connection)

VXFC10: One board allows outputs at merely 10 output points max. But the points can be increased to 20 and 30 output points by connecting cascades.

VXF2/VXFA2 Series Valve Characteristics

The valve characteristics data was measured with the outlet piping length. The valve characteristics vary depending on the tank capacity, air supply, set pressure, outlet conditions (nozzle size, quantity, piping length), so please use these values as a guideline.

1. Response Time, Start-up Speed

VXF2 Type

Measuring conditions

Test circuit Refer to the circuit below.

VXF23: Rc3/4 VXF24: Rc1
VXF25: Rc1 1/2 VXF26: Rc2
VXF27: Rc2 1/2 VXF28: Rc3

How to calculate

1. Set the tank pressure to 0.5 MPa.
2. Close the stop valve on the inlet of the tank.
3. Energize the valve and read the pressure wave on the outlet.

How to calculate

1. Set the tank pressure to 0.5 MPa.
2. Close the stop valve on the inlet of the tank.
3. Energize the pilot valve and read the pressure wave on the outlet.

VXFA2□ Test circuit

ON response time

Time required until the valve is switched after it is energized
(Time required until pressure is released to the outlet)

Start-up speed

Speed until the valve is switched after being energized and the pressure released to the outlet reaches 90% of the peak pressure

$$\text{Start-up speed} = (P_m \times 0.9) / \Delta t \quad [\text{MPa/msec}]$$

Note) For air operated type, the longer the piping length to the pilot valve, the longer the ON response time will be. If the piping length is extended more, the valve might not be opened due to piping capacity and resistance in the piping, so keep the piping length to the pilot valve as short as possible.

How to Read the Data

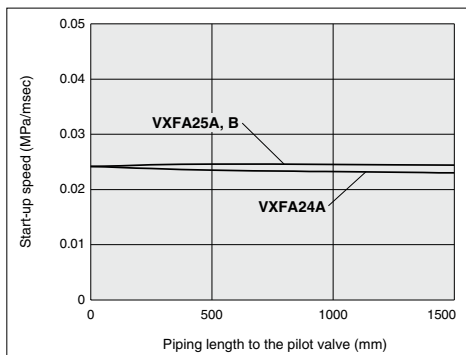

1. Response Time, Start-up Speed

For VXF2/solenoid valve type, the piping length to the pilot valve should be 0 mm.

Discharge volume: Valve discharge volume per energizing time

Conversion of the discharge volume

Calculate the discharge volume by reading the tank pressure after the valve starts the operation.

Conversion equation

$$V_0 = (P_1 \times V_1 - P_2 \times V_1) / P_0$$

V_0 : Discharge volume L

P_1 : Tank initial pressure MPa (Absolute pressure)

V_1 : Tank capacity L

How to calculate

1. Set the tank pressure to 0.5 MPa.
2. Close the stop valve on the inlet of the tank.
3. Energize the pilot valve and read the tank pressure after releasing the pressure.

- Note 1) If the regulator or the restrictor is installed right before the IN side of the valve, the valve may oscillate when it is turned off. Keep the regulator or the restrictor away from the valve for at least 1 m or change restriction.
- Note 2) The dust collector valve is a large flow control valve in which air is discharged with high speed to clean the bag filter with impact wave. Tank capacity should be sufficient to secure impact wave and discharge flow rate. If the air tank capacity is insufficient, response delay of valve, malfunctions or oscillation may occur.

Note 1) Spring is shipped together with the product, but not assembled.

Note 2) When the VXF26 is replaced with a silencer, and a silencer is attached later by the user, the operation may become unstable while ON. When attaching a silencer later, be sure to replace the diaphragm assembly as well. When ordering a product with a silencer and is used without the silencer, the operation may become unstable while OFF. In this case, the diaphragm assembly should be replaced.

Glossary of Terms

Pressure Terminology

1. Maximum operating pressure differential

The maximum pressure differential (the difference between the inlet and outlet pressure) which is allowed for operation. When the outlet pressure is 0 MPa, this becomes the maximum operating pressure.

2. Minimum operating pressure differential

The minimum pressure differential (the difference between the inlet pressure and outlet pressure) required to keep the main valve fully open.

3. Maximum system pressure

The maximum pressure that can be applied inside the pipelines (line pressure).

[The pressure differential of the solenoid valve portion must not exceed the maximum operating pressure differential.]

4. Withstand pressure

The pressure in which the valve must be withstood without a drop in performance after holding for one minute under prescribed pressure and returning to the operating pressure range. [value under the prescribed conditions]

Electrical Terminology

1. Apparent power (VA)

Volt-ampere is the product of voltage (V) and current (A).

Power consumption (W): For AC, $W = V \cdot A \cdot \cos \theta$.

For DC, $W = V \cdot A$.

Note) $\cos \theta$ shows power factor. $\cos \theta = 0.9$

2. Surge voltage

A high voltage which is momentarily generated by shutting off the power in the shut-off area.

3. Degree of protection

A degree defined in the "JIS C 0920: Waterproof test of electric machinery/appliance and the degree of protection against the intrusion of solid foreign objects."

Verify the degree of protection for each product.

● First Characteristics:

Degrees of protection against solid foreign objects

0	Non-protected
1	Protected against solid foreign objects of 50 mmφ and greater
2	Protected against solid foreign objects of 12 mmφ and greater
3	Protected against solid foreign objects of 2.5 mmφ and greater
4	Protected against solid foreign objects of 1.0 mmφ and greater
5	Dust-protected
6	Dust-tight

Electrical Terminology

● Second Characteristics:

Degrees of protection against water

0	Non-protected	—
1	Protected against vertically falling water drops	Dripproof type 1
2	Protected against vertically falling water drops when enclosure tilted up to 15°	Dripproof type 2
3	Protected against rainfall when enclosure tilted up to 60°	Rainproof type
4	Protected against splashing water	Splashproof type
5	Protected against water jets	Water-jet-proof type
6	Protected against powerful water jets	Powerful water-jet-proof type
7	Protected against the effects of temporary immersion in water	Immersible type
8	Protected against the effects of continuous immersion in water	Submersible type

Example) IP65: Dust-tight, Water-jet-proof type

"Water-jet-proof type" means that no water intrudes inside an equipment that could hinder from operating normally by means of applying water for 3 minutes in the prescribed manner. Take appropriate protection measures, since a device is not usable in an environment where a droplet of water is splashed constantly.

Others

1. Material

NBR: Nitrile rubber

FKM: Fluoro rubber

2. Symbol

In the symbol ($\square \square \square \square \square$), when the valve is closed, flow is blocked from port 1 to port 2. However, if the pressure in port 2 is higher than port 1, the valve will not be able to block the fluid and it will flow from port 2 to port 1.

Flat Terminal

1. Flat terminal/Electrical connection size of molded coil

VXF2/VXFA2 Series Specific Product Precautions 1

Be sure to read this before handling the products.

Refer to back page 50 for Safety Instructions and pages 17 to 19 for 2 Port Solenoid Valve for Fluid Control Precautions.

2 Port Solenoid Valve For Dust Collector VXF2/VXFA2 Series

Design

⚠ Warning

1. Cannot be used as an emergency shutoff valve etc.

The valves presented in this catalog are not designed for safety applications such as an emergency shutoff valve. If the valves are used in this type of system, other reliable safety assurance measures should also be adopted.

2. Extended periods of continuous energization

This is a valve for pulse operation. Do not energize it continuously. Since a large amount of air is consumed, the diaphragm will oscillate (chatter) due to insufficient air supply on the inlet side, and this can lead to failure.

3. When the conduit type is used as equivalent to an IP65 enclosure, install a wiring conduit etc.

Silencer

⚠ Caution

1. The silencer's response properties do not change in the initial stage, but will change due to the blockage after long use. Replace it after using about 500,000 times. This number is subject to change based on fluid quality and energizing time.

2. When using a silencer, make space for silencer replacement.

Selection

⚠ Warning

1. Air quality

1. Use clean air.

Do not use compressed air that contains chemicals, synthetic oils including organic solvents, salt or corrosive gases, etc., as it can cause damage or malfunction.

2. Install an air filter.

Install an air filter close to the valve on the upstream side. A filtration degree of 5 μm or less should be selected.

3. Install an aftercooler or air dryer, etc.

Compressed air that contains excessive drainage may cause malfunction of valves and other pneumatic equipment. To prevent this, install an aftercooler or air dryer, etc.

4. If excessive carbon powder is generated, eliminate it by installing a mist separator on the upstream side of valves.

If excessive carbon powder is generated by the compressor, it may adhere to the inside of the valves and cause a malfunction.

Refer to the Best Pneumatics No. 5 for further details on compressed air quality.

Selection

⚠ Warning

2. Ambient environment

Use within the allowable ambient temperature range. Check the compatibility between the product's composition materials and the ambient atmosphere. Be certain that the fluid used does not touch the external surface of the product.

3. Countermeasures against static electricity

Take measures to prevent static electricity since some fluids can cause static electricity.

4. Low temperature operation

- The valve can be used in fluid temperatures down to -10°C . However, take measures to prevent freezing or solidification of impurities, etc.
- When using the valve in cold climates, take appropriate countermeasures to prevent freezing in tubing by draining the water etc. When warming by a heater etc., be careful not to expose the coil portion to a heater. Installation of a dryer, heat retaining of the body is recommended to prevent a freezing condition in which the dew point temperature is high and the ambient temperature is low, and the high flow runs.

5. Fluid properties

Use a general compressed air with a filter of 5 μm or less mounted on the inlet of the piping. (Excluding dry air)

⚠ Caution

1. Leakage voltage

When the solenoid valve is operated using the controller, etc., the leakage voltage should be the product allowable leakage voltage or less. Particularly when using a resistor in parallel with a switching element and using a C-R element (surge voltage suppressor) to protect the switching element, take note that leakage current will flow through the resistor, C-R element, etc., creating a possible danger that the valve may not turn off.

AC coil: 5% or less of rated voltage
DC coil: 2% or less of rated voltage

- The response performance and start-up speed deteriorate in the case of air operated type (VXFA2) as compared with a solenoid valve type (VXF2). Refer to the data for pilot piping.
- Note that for DC, idle time and return time increase if the voltage is lowered. If a surge voltage suppressor is installed, the return speed decreases.

2 Port Solenoid Valve For Dust Collector VXF2/VXFA2 Series

Mounting

⚠ Warning

- If air leakage increases or equipment does not operate properly, stop operation.**
After mounting is completed, confirm that it has been done correctly by performing a suitable function test.
- Do not apply external force to the coil section.**
When tightening is performed, apply a wrench or other tool to the outside of the piping connection parts.
- Mount a valve with its coil position upward, not downward.**
When mounting a valve with its coil position downward, foreign objects in the fluid will adhere to the iron core leading to a malfunction. Especially for strict leakage control, such as with vacuum applications and non-leak specifications, the coil must be positioned upward.
- Do not warm the coil assembly with a heat insulator etc.**
Use tape, heaters, etc., for freeze prevention on the piping and body only. They can cause the coil to burn out.
- Avoid sources of vibration, or adjust the arm from the body to the minimum length so that resonance will not occur.**
- Painting and coating**
Warnings or specifications printed or labeled on the product should not be erased, removed or covered up.

⚠ Caution

- Machine the mounting surface shape so that there are no gaps between the mounting surface and the product.**

Piping

⚠ Warning

- During use, deterioration of the tube or damage to the fittings could cause tubes to come loose from their fittings and thrash about.**
To prevent uncontrolled tube movement, install protective covers or fasten tubes securely in place.
- For piping the tube, fix the product securely using the mounting holes so that the product is not in the air.**

Piping

⚠ Caution

- Preparation before piping**
Before piping is connected, it should be thoroughly blown out with air (flushing) or washed to remove chips, cutting oil and other debris from inside the pipe.
Install piping so that it does not apply pulling, pressing, bending or other forces on the valve body.
- Avoid connecting ground lines to piping, as this may cause electric corrosion of the system.**
- Always tighten threads with the proper tightening torque.**
When attaching fittings to valves, tighten with the proper tightening torque shown below.

Tightening Torque for Piping

Connection thread	Proper tightening torque N·m	Connection thread	Proper tightening torque N·m
Rc1/4	12 to 14	Rc1 1/2	40 to 42
Rc3/8	22 to 24	Rc2	48 to 50
Rc1/2	28 to 30	Rc2 1/2	48 to 50
Rc3/4	28 to 30	Rc3	48 to 50
Rc1	36 to 38		

- When connecting piping to a product**
Avoid mistakes regarding the supply port etc.
- If a regulator, or a restrictor, is installed immediately before or after the IN port of the valve, the main valve may oscillate (chatter). Install them away from the valve or change the restriction.
- The header tank capacity should be sufficient. This is a valve for large flow rate, so if the capacity is small, the main valve may oscillate due to pressure drop or insufficient air supply.

Wiring

⚠ Warning

- The solenoid valve is an electrical product. For safety, install an appropriate fuse and circuit breaker before use.**
When using multiple solenoid valves, it is not sufficient to merely install one fuse on the inlet side. In order to ensure the safety of the devices, select and install a fuse for each circuit.

⚠ Caution

- As a rule, use electrical wire with a cross sectional area of 0.5 to 1.25 mm² for wiring.**
Furthermore, do not allow excessive force to be applied to the lines.
- Use electrical circuits which do not generate chattering in their contacts.**
- Use voltage which is within ±10% of the rated voltage.** In cases with a DC power supply where importance is placed on responsiveness, stay within ±5% of the rated value. The voltage drop is the value in the lead wire section connecting the coil.
- When a surge from the solenoid affects the electrical circuitry, install a surge voltage suppressor etc. in parallel with the solenoid. Or, adopt an option that comes with the surge voltage protection circuit.**
(However, a surge voltage occurs even if the surge voltage protection circuit is used. For details, please consult with SMC.)

2 Port Solenoid Valve For Dust Collector VXF2/VXFA2 Series

Operating Environment

⚠ Warning

1. Do not use in an atmosphere having corrosive gases, chemicals, sea water, water, water vapor, or where there is direct contact with any of these.
2. Do not use in explosive atmospheres.
3. Do not use in locations subject to vibration or impact.
4. Do not use in locations where radiated heat will be received from nearby heat sources.
5. Employ suitable protective measures in locations where there is contact with water droplets, oil or welding spatter, etc.

Maintenance

⚠ Warning

1. **Removing the product**
The valve becomes hot depending on the fluid temperature. Confirm that the valve temperature has dropped sufficiently before performing work. If touched inadvertently, there is a danger of being burned.
 1. Shut off the fluid supply and release the fluid pressure in the system.
 2. Shut off the power supply.
 3. Remove the product.
2. **Low frequency operation**
Switch valves at least once every 30 days to prevent malfunction. Also, in order to use it under the optimum state, conduct a regular inspection once a half year.

⚠ Caution

1. **Filters**
 1. Be careful regarding clogging of filters.
 2. Replace filter elements after one year of use, or earlier if the pressure drop reaches 0.1 MPa.
2. **Storage**
In case of long term storage after use, thoroughly remove all moisture to prevent rust and deterioration of rubber materials etc.
3. **Exhaust the drainage from an air filter periodically.**

■ DIN terminal

Disassembly

1. After loosening the binding head screw with flange, then if the housing is pulled in the direction of the arrow, the connector will be removed from the solenoid valve.
2. Pull out the binding head screw with flange from the housing.
3. There is a cutout on the bottom of the terminal block. Insert a small flat head screwdriver, etc. into this cutout, and remove the terminal block from the housing. (See figure below.)
4. Remove the ground nut, and pull out the washer and the rubber seal.

Wiring

1. Pass the cable through the ground nut, washer and rubber seal in this order, and insert these parts into the housing.
2. Loosen the binding head screw of the terminal block, then insert the core wire or the crimped terminal of the lead wire into the terminal, and securely fix it with the binding head screw. The binding head screw of the terminal block is M3.
Note 1) Tighten the screw to a torque of between 0.5 and 0.6 N·m.
Note 2) Cable O.D.: $\phi 6$ to $\phi 12$ mm
Note 3) For an outside cable diameter of $\phi 9$ to 12 mm, remove the internal parts of the rubber seal before using.

Assembly

1. Pass the cable through the ground nut, washer, rubber seal and the housing in this order, and connect to the terminal block. Then, set the terminal block inside the housing. (Push in the terminal block until it snaps into position.)
2. Insert the rubber seal and the washer in this order into the cable entry of the housing, and then tighten the ground nut securely.
3. Insert the gasket between the bottom part of the terminal block and the plug attached to the equipment, and then insert the binding head screw with flange from the top of the housing, and tighten it.
Note 1) Tighten the screw to a torque of between 0.5 and 0.6 N·m.
Note 2) The orientation of the connector can be changed in steps of 90° by changing the method of assembling the housing and the terminal block.

Applicable crimped terminal: JIS C2805 R1.25-3

*1 The position is fixed regardless of the electrical entry direction.

DIN (EN175301-803) Terminal

This DIN terminal corresponds to the Form A DIN connector with an 18 mm terminal pitch, which complies with EN175301-803B.

■ Conduit terminal

Disassembly

- Loosen the mounting screw, and remove the terminal cover from the conduit terminal.

Wiring

- Insert the cable into the conduit terminal.
- Loosen the screw with UP terminal of the conduit terminal, then insert the core wire or the crimped terminal of the lead wire into the terminal, and securely fix it with the screw with UP terminal.
Note 1) Tighten the screw to a torque of between 0.5 and 0.6 N-m.

⚠ Caution

■ Conduit terminal

Assembly

- Insert the gasket into the conduit terminal, and then clamp the terminal cover with the mounting screw.

Note 1) Tighten the screw to a torque of between 0.5 and 0.6 N-m.

Note 2) When changing the orientation of the conduit terminal, carry out the following procedure.

- Apply a tool (monkey wrench, spanner, etc.) to the width across flats of the conduit terminal, and turn the terminal in the counterclockwise direction.
- Loosen the lock nut.
- Turn the conduit terminal in the clamping direction (clockwise direction) to about 15° ahead of the desired position.
- Turn the lock nut by hand to the coil side until it is lightly tightened.

Note) When changing the orientation by applying additional tightening force to the conduit terminal from the factory-set position, turn no more than one half a turn.

Make connections according to the marks shown below.

- Use the tightening torques below for each section.
- Properly seal the terminal connection (G1/2) with the special wiring conduit etc.

Dedicated Controller For Operation VXFC Series

Wiring

⚠ Warning

1. The controller starts its output the moment the power switch is turned ON. Be aware that even if the power switch is turned OFF, power is connected to the terminal block.

⚠ Caution

1. Make sure that the power supply voltage to be input matches the voltage in the controller's specifications. The power supply voltage that has been input becomes the voltage that is output to the solenoid valves.
2. Connect a ground that is rated Class 3 or greater to the power supply terminal block's FG.
3. If the power source is DC, use caution to its polarity. If the polarity is incorrect, it may result in a malfunction or damage.
4. For details, refer to the separate Operation Manual.
5. The solenoid valve mounted on the controller should be equipped with a surge voltage suppressor.

Operating Environment

⚠ Warning

1. Operate under conditions that are free of vibration and impact.
2. Operate in an ambient temperature range between 0°C and 50°C.
3. Operate in an ambient humidity range between 45% to 85% (with no condensation).
